

# COMP9414 Artificial Intelligence

## Assignment 1: Constraint Satisfaction Search

@Authors: **Wayne Wobcke, Alfred Krzywicki, Stefano Mezza**

**Due Date:** Week 5, Friday, October 17, 5.00pm

### Objective

This assignment concerns developing optimal solutions to a scheduling problem inspired by the scenario of a manufacturing plant that has to fulfil multiple customer orders with varying deadlines, but where there may be constraints on tasks and on relationships between tasks. Any number of tasks can be scheduled at the same time, but it is possible that some tasks cannot be finished before their deadline. A task finishing late is acceptable, however incurs a cost, which for this assignment is a simple (dollar) amount per hour that the task is late.

A *fuzzy scheduling* problem in this scenario is simplified by ignoring customer orders and having just one machine and a number of *tasks*, each with a fixed duration in hours. Each task must start and finish on the same day, within working hours (9am to 5pm). In addition, there can be *constraints*, both on single tasks and between two tasks. One type of constraint is that a task can have a deadline, which can be “hard” (the deadline must be met in any valid schedule) or “soft” (the task may be finished late – though still at or before 5pm – but with a “cost” per hour for missing the deadline). The aim is to develop an overall schedule for all the tasks (in a single week) that minimizes the total cost of all the tasks that finish late, provided that all the hard constraints on tasks are satisfied.

More technically, this assignment is an example of a *constraint optimization problem* (or *constrained optimization problem*), a problem that has constraints like a standard Constraint Satisfaction Problem (CSP), but also a *cost* associated with each solution. For this assignment, we will use a *greedy* algorithm to find optimal solutions to fuzzy scheduling problems that are specified as text strings. However, unlike the greedy search algorithm described in the lectures on search, this greedy algorithm has the property that it is guaranteed to find an optimal solution for any problem (if a solution exists).

The assignment will use the AI code of Poole & Mackworth. You are given code to translate fuzzy scheduling problems specified as text strings into CSPs with a cost, and you are given code for several constraint solving algorithms – based on domain splitting and arc consistency, and based on depth-first search. The assignment will be to implement some missing procedures and to analyse the performance of the constraint solving methods, both analytically and experimentally.

### Submission Instructions

- This is an individual assignment.
- Write your answers in **this** notebook and submit **this** notebook on Moodle under **Assignment 1**.
- Name your submission `<zid>-<firstname>-<lastname>.ipynb` where `<firstname>-<lastname>` is your **real** (not Moodle) name.
- Make sure you set up AI Python (as done below) so the code can be run on either CSE machines or a marker's own machine.
- Do not submit any AI Python code. Hence do not change any AI Python code to make your code run.
- Make sure your notebook runs cleanly (restart the kernel, clear all outputs and run each cell to check).
- After checking that your notebook runs cleanly, run all cells and submit the notebook **with** the outputs included (do not submit the empty version).
- Make sure images (for plots/graphs) are **included** in the notebook you submit (sometimes images are saved on your machine but are not in the notebook).
- Do not modify the existing code in this notebook except to answer the questions. Marks will be given as and where indicated.
- If you want to submit additional code (e.g. for generating plots), add that at the end of the notebook.
- **Important: Do not distribute any of this code on the Internet. This includes ChatGPT. Do not put this assignment into any LLM.**

## Late Penalties

Standard UNSW late penalties apply (5% of the value of the assignment per day or part day late).

**Note:** Unlike the CSE systems, there is no grace period on Moodle. The due date and time is 5pm **precisely** on Friday October 17.

**Important: You can submit as many times as you want before the due date, but if you do submit before the due date, you cannot submit on Moodle after the due date. If you do not submit before the due date, you can submit on Moodle after the due date.**

## Plagiarism

Remember that ALL work submitted for this assignment must be your own work and no sharing or copying of code or answers is allowed. You may discuss the assignment with other students but must not collaborate on developing answers to the questions. You

may use code from the Internet only with suitable attribution of the source. You may not use ChatGPT or any similar software to generate any part of your explanations, evaluations or code. Do not use public code repositories on sites such as github or file sharing sites such as Google Drive to save any part of your work – make sure your code repository or cloud storage is private and do not share any links. This also applies after you have finished the course, as we do not want next year's students accessing your solution, and plagiarism penalties can still apply after the course has finished.

All submitted assignments will be run through plagiarism detection software to detect similarities to other submissions, including from past years. You should **carefully** read the UNSW policy on academic integrity and plagiarism (linked from the course web page), noting, in particular, that collusion (working together on an assignment, or sharing parts of assignment solutions) is a form of plagiarism.

Finally, do not use any contract cheating “academies” or online “tutoring” services. This counts as serious misconduct with heavy penalties up to automatic failure of the course with 0 marks, and expulsion from the university for repeat offenders.

## Fuzzy Scheduling

A CSP for this assignment is a set of variables representing tasks, binary constraints on pairs of tasks, and unary constraints (hard or soft) on tasks. The domains are all the working hours in one week, and a task duration is in hours. Days are represented (in the input and output) as strings ‘mon’, ‘tue’, ‘wed’, ‘thu’ and ‘fri’, and times are represented as strings ‘9am’, ‘10am’, ‘11am’, ‘12pm’, ‘1pm’, ‘2pm’, ‘3pm’, ‘4pm’ and ‘5pm’. The only possible values for the start and end times of a task are combinations of a day and times, e.g. ‘mon 9am’. Each task name is a string (with no spaces), and the only soft constraints are the soft deadline constraints.

There are three types of constraint:

- **Binary Constraints:** These specify a hard requirement for the relationship between two tasks.
- **Hard Domain Constraints:** These specify hard requirements for the tasks themselves.
- **Soft Deadline Constraints:** These constraints specify that a task may finish late, but with a given cost.

Each soft constraint has a function defining the *cost* associated with violating the preference, that the constraint solver must minimize, while respecting all the hard constraints. The *cost* of a solution is simply the sum of the costs for the soft constraints that the solution violates (and is always a non-negative integer).

This is the list of possible constraints for a fuzzy scheduling problem (comments below are for explanation and do **not** appear in the input specification; however, the code we supply *should* work with comments that take up a full line):

```

# binary constraints
constraint, <t1> before <t2>                      # t1 ends when or before
t2 starts
constraint, <t1> after <t2>                         # t1 starts after or when
t2 ends
constraint, <t1> same-day <t2>                      # t1 and t2 are scheduled
on the same day
constraint, <t1> starts-at <t2>                     # t1 starts exactly when
t2 ends

# hard domain constraints
domain, <t>, <day>, hard                           # t
starts on given day at any time
domain, <t>, <time>, hard                            # t
starts at given time on any day
domain, <t>, starts-before <day> <time>, hard      # t
starts at or before day, time
domain, <t>, starts-after <day> <time>, hard        # t
starts at or after day, time
domain, <t>, ends-before <day> <time>, hard         # t
ends at or before day, time
domain, <t>, ends-after <day> <time>, hard          # t
starts at or after day, time
domain, <t>, starts-in <day1> <time1>-<day2> <time2>, hard # day-
time range for start time; includes day1, time1 and day2, time2
domain, <t>, ends-in <day1> <time1>-<day2> <time2>, hard   # day-
time range for end time; includes day1, time1 and day2, time2
domain, <t>, starts-before <time>, hard              # t
starts at or before time on any day
domain, <t>, ends-before <time>, hard                # t
ends at or before time on any day
domain, <t>, starts-after <time>, hard              # t
starts at or after time on any day
domain, <t>, ends-after <time>, hard                # t
ends at or after time on any day

# soft deadline constraint
domain, <t>, ends-by <day> <time> <cost>, soft      # cost per
hour of missing deadline

```

The input specification will consist of several “blocks”, listing the tasks, binary constraints, hard unary constraints and soft deadline constraints for the given problem. A “declaration” of each task will be included before it is used in a constraint. A sample input specification is as follows. Comments are for explanation and do **not** have to be included in the input.

```

# two tasks with two binary constraints and soft deadlines
task, t1 3
task, t2 4
# two binary constraints
constraint, t1 before t2
constraint, t1 same-day t2
# domain constraint
domain, t2 mon

```

```
# soft deadline constraints  
domain, t1 ends-by mon 3pm 10  
domain, t2 ends-by mon 3pm 10
```

# Preparation

## 1. Set up AlPython

You will need AlPython for this assignment. To find the aipython files, the aipython directory has to be added to the Python path.

Do this temporarily, as done here, so we can find AlPython and run your code (you will not submit any AlPython code).

You can add either the full path (using `os.path.abspath()`), or as in the code below, the relative path.

```
In [37]: import sys  
sys.path.append('aipython') # change to your directory  
sys.path # check that aipython is now on the path
```

```
Out[37]: ['C:\\Program Files\\WindowsApps\\PythonSoftwareFoundation.Python.3.12_3.12.280  
0.0_x64_qbz5n2kfra8p0\\python312.zip',  
 'C:\\Program Files\\WindowsApps\\PythonSoftwareFoundation.Python.3.12_3.12.280  
0.0_x64_qbz5n2kfra8p0\\DLLs',  
 'C:\\Program Files\\WindowsApps\\PythonSoftwareFoundation.Python.3.12_3.12.280  
0.0_x64_qbz5n2kfra8p0\\Lib',  
 'C:\\Program Files\\WindowsApps\\PythonSoftwareFoundation.Python.3.12_3.12.280  
0.0_x64_qbz5n2kfra8p0',  
 '',  
 'C:\\Users\\jelly\\AppData\\Local\\Packages\\PythonSoftwareFoundation.Python.  
3.12_qbz5n2kfra8p0\\LocalCache\\local-packages\\Python312\\site-packages',  
 'C:\\Users\\jelly\\AppData\\Local\\Packages\\PythonSoftwareFoundation.Python.  
3.12_qbz5n2kfra8p0\\LocalCache\\local-packages\\Python312\\site-packages\\win3  
2',  
 'C:\\Users\\jelly\\AppData\\Local\\Packages\\PythonSoftwareFoundation.Python.  
3.12_qbz5n2kfra8p0\\LocalCache\\local-packages\\Python312\\site-packages\\win32  
\\lib',  
 'C:\\Users\\jelly\\AppData\\Local\\Packages\\PythonSoftwareFoundation.Python.  
3.12_qbz5n2kfra8p0\\LocalCache\\local-packages\\Python312\\site-packages\\Pytho  
nwin',  
 'C:\\Program Files\\WindowsApps\\PythonSoftwareFoundation.Python.3.12_3.12.280  
0.0_x64_qbz5n2kfra8p0\\Lib\\site-packages',  
 'aipython',  
 'aipython',  
 'aipython']
```

## 2. Representation of Day Times

Input and output are day time strings such as 'mon 10am' or a range of day time strings such as 'mon 10am-mon 4pm'.

The CSP will represent these as integer hour numbers in the week, ranging from 0 to 39.

The following code handles the conversion between day time strings and hour numbers.

```
In [38]: # -*- coding: utf-8 -*-

""" day_time string format is a day plus time, e.g. Mon 10am, Tue 4pm, or just T
if only day or time, returns day number or hour number only
day_time strings are converted to and from integer hours in the week from 0
"""
class Day_Time():
    num_hours_in_day = 8
    num_days_in_week = 5

    def __init__(self):
        self.day_names = ['mon', 'tue', 'wed', 'thu', 'fri']
        self.time_names = ['9am', '10am', '11am', '12pm', '1pm', '2pm', '3pm', '4pm']

    def string_to_week_hour_number(self, day_time_str):
        """ convert a single day_time into an integer hour in the week """
        value = None
        value_type = None
        day_time_list = day_time_str.split()
        if len(day_time_list) == 1:
            str1 = day_time_list[0].strip()
            if str1 in self.time_names: # this is a time
                value = self.time_names.index(str1)
                value_type = 'hour_number'
            else:
                value = self.day_names.index(str1) # this is a day
                value_type = 'day_number'
            # if not day or time, throw an exception
        else:
            value = self.day_names.index(day_time_list[0].strip())*self.num_hours_in_day
            + self.time_names.index(day_time_list[1].strip())
            value_type = 'week_hour_number'
        return (value_type, value)

    def string_to_number_set(self, day_time_list_str):
        """ convert a list of day-times or ranges 'Mon 9am, Tue 9am-Tue 4pm' int
        e.g. 'mon 9am-1pm, mon 4pm' -> [0,1,2,3,4,7]

    day_number = int(self.week_hour_number / self.num_hours_in_day)
    return self.day_names[day_number] + ' ' + self.time_names[day_hour_number]

```

### 3. Constraint Satisfaction Problems with Costs over Tasks with Durations

Since AI Python does not provide the CSP class with an explicit cost, we implement our own class that extends `CSP`.

We also store the cost functions and the durations of all tasks explicitly in the CSP.

The durations of the tasks are used in the `hold` function to evaluate constraints.

```
In [39]: from cspProblem import CSP, Constraint

# We need to override Constraint, because tasks have durations
class Task_Constraint(Constraint):
    """A Task_Constraint consists of
    * scope: a tuple of variables
    * spec: text description of the constraint used in debugging
    * condition: a function that can applied to a tuple of values for the variab
    * durations: durations of all tasks
    * func_key: index to the function used to evaluate the constraint
    """

    def __init__(self, scope, spec, condition, durations, func_key):
        super().__init__(scope, condition, spec)
        self.scope = scope
        self.condition = condition
        self.durations = durations
        self.func_key = func_key

    def holds(self, assignment):
        """returns the value of Constraint con evaluated in assignment.

        precondition: all variables are assigned in assignment

        CSP has only binary constraints
        condition is in the form week_hour_number1, week_hour_number2
        add task durations as appropriate to evaluate condition
        """
        if self.func_key == 'before':
            # t1 ends before t2 starts, so we need add duration to t1 assignment

```

```

        ass0 = assignment[self.scope[0]] + self.durations[self.scope[0]]
        ass1 = assignment[self.scope[1]]
    elif self.func_key == 'after':
        # t2 ends before t1 starts so we need add duration to t2 assignment
        ass0 = assignment[self.scope[0]]
        ass1 = assignment[self.scope[1]] + self.durations[self.scope[1]]
    elif self.func_key == 'starts-at':
        # t1 starts exactly when t2 ends, so we need add duration to t2 assi
        ass0 = assignment[self.scope[0]]
        ass1 = assignment[self.scope[1]] + self.durations[self.scope[1]]
    else:
        return self.condition(*tuple(assignment[v] for v in self.scope))
    # condition here comes from get_binary_constraint
    return self.condition(*tuple([ass0, ass1]))

# implement nodes as CSP problems with cost functions
class CSP_with_Cost(CSP):

        return neights

    def heuristic(self, n):
        return n.cost

```

## 4. Fuzzy Scheduling Constraint Satisfaction Problems

The following code sets up a CSP problem from a given specification.

Hard (unary) domain constraints are applied to reduce the domains of the variables before the constraint solver runs.

```
In [41]: # domain specific CSP builder for week schedule
class CSP_builder():
```

```

# List of text lines without comments and empty lines
_, default_domain = Day_Time().string_to_number_set('mon 9am-fri 4pm') # show

# hard unary constraints: domain is a list of values, params is a single val
# starts-before, ends-before (for starts-before duration should be 0)
# vals in domain are actual task start/end date/time, so must be val <= what
def apply_before(self, param_type, params, duration, domain):
    domain_orig = domain.copy()
    param_val = params.pop()
    for val in domain_orig: # val is week_hour_number
        val1 = val + duration
        h, d = Day_Time().hour_day_split(val1)
        if param_type == 'hour_number' and h > param_val:
            if val in domain: domain.remove(val)
        if param_type == 'day_number' and d > param_val:
            if val in domain: domain.remove(val)
        if param_type == 'week_hour_number' and val1 > param_val:
            if val in domain: domain.remove(val)
    return domain

def apply_after(self, param_type, params, duration, domain):
    domain_orig = domain.copy()
    param_val = params.pop()
    for val in domain_orig: # val is week_hour_number
        val1 = val + duration

## 5. Greedy Search Constraint Solver using Domain Splitting and Arc Consistency

Create a GreedySearcher to search over the CSP.

The *cost* function for CSP nodes is used as the heuristic, but is actually a direct estimate of the total path cost function  $f$  used in A\* Search.

```
In [42]: from searchGeneric import AStarSearcher

class GreedySearcher(AStarSearcher):
    """ returns a searcher for a problem.
    Paths can be found by repeatedly calling search().
    """
    def add_to_frontier(self, path):
        """ add path to the frontier with the appropriate cost """
        # value = path.cost + self.problem.heuristic(path.end()) -- A* definitio
        value = path.end().cost
        self.frontier.add(path, value)
```

Run the GreedySearcher on the CSP derived from the sample input.

**Note: The solution cost will always be 0 (which is wrong for the sample input) until you write the cost function in the cell above.**

```
In [43]: # Sample problem specification

sample_spec = """
# two tasks with two binary constraints and soft deadlines
task, t1 3
task, t2 4
```

```

# two binary constraints
constraint, t1 before t2
constraint, t1 same-day t2
# domain constraint
domain, t2 mon
# soft deadlines
domain, t1 ends-by mon 3pm 10
domain, t2 ends-by mon 3pm 10
"""

```

```

In [44]: # display details (0 turns off)
Con_solver.max_display_level = 0
Search_with_AC_from_Cost_CSP.max_display_level = 2
GreedySearcher.max_display_level = 0

def test_csp_solver(searcher):
    final_path = searcher.search()
    if final_path == None:
        print('No solution')
    else:
        domains = final_path.end().domains
        result_str = ''
        for name, domain in domains.items():
            for n in domain:
                result_str += '\n'+str(name)+': '+Day_Time().week_hour_number_to
        print(result_str[1:]+\ncost: '+str(final_path.end().cost))

csp_problem = create_CSP_from_spec(sample_spec)
solver = GreedySearcher(Search_with_AC_from_Cost_CSP(csp_problem))
test_csp_solver(solver)

task, t1 3
task, t2 4
constraint, t1 before t2
constraint, t1 same-day t2
domain, t2 mon
domain, t1 ends-by mon 3pm 10
domain, t2 ends-by mon 3pm 10
t1: mon 9am
t2: mon 12pm
cost: 10

```

## 6. Depth-First Search Constraint Solver

The Depth-First Constraint Solver in AI<sup>Python</sup> by default uses a random ordering of the variables in the CSP.

We need to modify this code to make it compatible with the arc consistency solver.

Run the solver by calling `dfs_solve1` (first solution) or `dfs_solve_all` (all solutions).

```

In [45]: num_expanded = 0
display = False

def dfs_solver(constraints, domains, context, var_order):
    """ generator for all solutions to csp
        context is an assignment of values to some of the variables
        var_order is a list of the variables in csp that are not in context

```

```

"""
global num_expanded, display
to_eval = {c for c in constraints if c.can_evaluate(context)}
if all(c.holds(context) for c in to_eval):
    if var_order == []:
        print("Nodes expanded to reach solution:", num_expanded)
        yield context
    else:
        rem_cons = [c for c in constraints if c not in to_eval]
        var = var_order[0]
        for val in domains[var]:
            if display:
                print("Setting", var, "to", val)
            num_expanded += 1
            yield from dfs_solver(rem_cons, domains, context|{var:val}, var_
            var_order[1:])
else:
    yield context

def dfs_solve_all(csp, var_order=None):
    """ depth-first CSP solver to return a list of all solutions to csp """
    global num_expanded
    num_expanded = 0
    if var_order == None:      # use an arbitrary variable order
        var_order = list(csp.domains)
    return list(dfs_solver(csp.constraints, csp.domains, {}, var_order))

def dfs_solve1(csp, var_order=None):
    """ depth-first CSP solver """
    global num_expanded
    num_expanded = 0
    if var_order == None:      # use an arbitrary variable order
        var_order = list(csp.domains)
    for sol in dfs_solver(csp.constraints, csp.domains, {}, var_order):
        return sol # return first one

```

Run the Depth-First Solver on the sample problem.

**Note: Again there are no costs calculated.**

```
In [46]: def test_dfs_solver(csp_problem):
    solution = dfs_solve1(csp_problem)
    if solution == None:
        print('No solution')
    else:

```

## 7. Depth-First Search Constraint Solver using Forward Checking with MRV Heuristic

The Depth-First Constraint Solver in AI`Python` by default uses a random ordering of the variables in the CSP.

We redefine the `dfs_solver` methods to implement the MRV (Minimum Remaining Values) heuristic using forward checking.

Because the AI`Python` code is designed to manipulate domain sets, we also need to redefine `can_evaluate` to handle partial assignments.

```
In [47]: num_expanded = 0
display = False

def can_evaluate(c, assignment):
    """ assignment is a variable:value dictionary
        returns True if the constraint can be evaluated given assignment
    """
    return assignment != {} and all(v in assignment.keys() and type(assignment[v]) == set for v in c.variables)

def mrv_dfs_solver(constraints, domains, context, var_order):
    """ generator for all solutions to csp.
        context is an assignment of values to some of the variables.
        var_order is a list of the variables in csp that are not in context.
    """
    global num_expanded, display
    if display:
        print("Context", context)
    to_eval = {c for c in constraints if can_evaluate(c, context)}
    if all(c.holds(context) for c in to_eval):
        if var_order == []:
            print("Nodes expanded to reach solution:", num_expanded)
            yield context
        else:
            rem_cons = [c for c in constraints if c not in to_eval] # constraint
            var = var_order[0]
            rem_vars = var_order[1:]
            for val in domains[var]:
                if display:
                    print("Setting", var, "to", val)
                num_expanded += 1
                rem_context = context | {var:val}
                # apply forward checking on remaining variables
                if len(var_order) > 1:
                    rem_vars_original = list((v, list(domains[v].copy())) for v
```

```

        if display:
            print("Original domains:", rem_vars_original)
            # constraints that can't already be evaluated in rem_cons
            rem_cons_ff = [c for c in constraints if c in rem_cons and not c.holds(rem_context)]
            for rem_var in rem_vars:
                # constraints that can be evaluated by adding a value of
                any_value = list(domains[rem_var])[0]
                rem_to_eval = {c for c in rem_cons_ff if can_evaluate(c,
                # new domain for rem_var are the values for which all ne
                rem_vals = domains[rem_var].copy()
                for rem_val in domains[rem_var]:

## Assignment

**Name:** Kevin Ryan

**zID:** z5712369

### Question 1 (4 marks)

Consider the search spaces for the fuzzy scheduling CSP solvers – domain splitting with arc consistency and the DFS solver (without forward checking).

- Describe the search spaces in terms of start state, successor functions and goal state(s) (1 mark)
- What is the branching factor and maximum depth to find any solution for the two algorithms (ignoring costs)? (1 mark)
- What is the worst case time and space complexity of the two search algorithms? (1 mark)
- Give one example of a fuzzy scheduling problem that is *easier* for the domain splitting with arc consistency solver than it is for the DFS solver, and explain why (1 mark)

For the second and third part-questions, give the answer in a general form in terms of fuzzy scheduling CSP size parameters.

#### Answers for Question 1

Write the answers here.

**Describe the search spaces in terms of start state, successor functions and goal state(s) (1 mark)**

Domain Splitting with Arc Consistency

- Initial state: The initial CSP with variable domains pruned by a first pass of arc consistency.
- Successor function: Select a variable with more than one value in its domain, partition its domain to create two new sub-problems (states), and apply arc consistency to each.
- Goal state: A CSP where every variable's domain contains exactly one value.

### DFS Solver

- Initial state: An empty assignment.
- Successor function: Assign a value to the next unassigned variable that does not conflict with previously assigned variables.
- Goal state: A complete assignment of values to all variables that satisfies all constraints.

### **What is the branching factor and maximum depth to find any solution for the two algorithms (ignoring costs)? (1 mark)**

n: number of variables. d: maximum domain size.

Domain Splitting with Arc Consistency: branching = 2, depth =  $n * \log_2(d)$

DFS: branching = d, depth = n

### **What is the worst case time and space complexity of the two search algorithms? (1 mark)**

n: number of variables. d: maximum domain size.

DFS: Time =  $O(d^n)$ , Space =  $O(n)$

Domain Splitting with Arc Consistency: Time =  $O(d^n)$ , Space =  $O(n * d)$

### **Give one example of a fuzzy scheduling problem that is easier for the domain splitting with arc consistency solver than it is for the DFS solver, and explain why (1 mark)**

A problem where tasks have long durations and a same day constraint would be easier for the domain splitting with arc consistency. For example there are multiple tasks with a deadline due within the same day. The arc consistency would quickly prune impossible start times, such as the other days, whereas the DFS would attempt invalid combinations before backtracking.

## Question 2 (5 marks)

Define the cost function for a fuzzy scheduling CSP (i.e. a node in the search space for domain splitting and arc consistency) as the total cost of the soft deadline constraints violated for all of the variables, assuming that each variable is assigned one of the best possible values from its domain, where a "best" value for a variable  $v$  is one that has the lowest cost to violate the soft deadline constraint (if any) for that variable  $v$ .

- Implement the cost function in the indicated cell and place a copy of the code below (3 marks)
- What is its computational complexity (give a general form in terms of fuzzy scheduling CSP size parameters)? (1 mark)
- Show that the cost function  $f$  never decreases along a path, and explain why this means the search algorithm is optimal (1 mark)

```
In [49]: # Code for Question 2
# Place a copy of your code here and run it in the relevant cell

# def calculate_cost(self):
#     cost = 0

#     for var in self.domains:
#         domain_values = self.domains[var]

#         min_cost_for_var = float('inf')

#         for domain_val in domain_values:
#             cost_func = self.cost_functions[var][0]

#             var_cost = cost_func(domain_val, self.soft_day_time[var], self)

#             if var_cost is not None and var_cost < min_cost_for_var:
#                 min_cost_for_var = var_cost

#             if min_cost_for_var != float('inf'):
#                 cost += min_cost_for_var

#     return cost
```

## Answers for Question 2

Write the other answers here.

**What is its computational complexity (give a general form in terms of fuzzy scheduling CSP size parameters)? (1 mark)**

$O(n * d)$

**Show that the cost function  $f$  never decreases along a path, and explain why this means the search algorithm is optimal (1 mark)**

The  $f$  never decreases along a path because as we move along the path, the domain splitting means that the domains only get smaller into children, not adding better ones, so values are only removed not added. Since the cost for each variable is calculated from minimum soft constraint over its domain, removing values cannot decrease the minimum cost for that variable but only stay the same or increase. Thus the  $f$  will never decrease along a path.

This property of not decreasing makes it monotonic, and since  $f$  represents the lower bound of a cost that will never decrease and always underestimates or equals the true cost, the exploration of solutions can be considered optimal

## Question 3 (4 marks)

Conduct an empirical evaluation of the domain splitting CSP solver using the cost function defined as above compared to using no cost function (i.e. the zero cost function, as originally defined in the above cell). Use the *average number of nodes expanded* as a metric to compare the two algorithms.

- Write a function `generate_problem(n)` that takes an integer `n` and generates a problem specification with `n` tasks and a random set of hard constraints and soft deadline constraints in the correct format for the constraint solvers (2 marks)

Run the CSP solver (with and without the cost function) over a number of problems of size `n` for a range of values of `n`.

- Plot the performance of the two constraint solving algorithms on the above metric against `n` (1 mark)
- Quantify the performance gain (if any) achieved by the use of this cost function (1 mark)

### Quantify the performance gain (if any) achieved by the use of this cost function (1 mark)

There is a 0% performance gain, they both perform the same

```
In [50]: import random

def generate_problem(n):
    days = ['mon', 'tue', 'wed', 'thu', 'fri']
    times = ['9am', '10am', '11am', '12pm', '1pm', '2pm', '3pm', '4pm']
    costs = [5, 10, 15, 20]

    lines = []
    tasks = [f"t{i+1}" for i in range(n)]

    for t in tasks:
        dur = random.randint(1, min(7, 8))
        lines.append(f"task, {t} {dur}")

    if n >= 2:
        num_bin = random.randint(0, min(2, n - 1))
        for _ in range(num_bin):
            t1, t2 = random.sample(tasks, 2)
            rel = random.choice(['before', 'same-day'])
            lines.append(f"constraint, {t1} {rel} {t2}")

    for t in tasks:
        day = random.choice(days)
        lines.append(f"domain, {t} {day}")

    for t in tasks:
        day = random.choice(days)
        time = random.choice(times)
        cost = random.choice(costs)
        lines.append(f"domain, {t} ends-by {day} {time} {cost}")
```

```

## Question 4 (5 marks)

Compare the Depth-First Search (DFS) solver to the Depth-First Search solver using forward checking with Minimum Remaining Values heuristic (DFS-MRV). For this question, ignore the costs associated with the CSP problems.

- What is the worst case time and space complexity of each algorithm (give a general form in terms of fuzzy scheduling problem sizes)? (1 mark)
- What are the properties of the search algorithms (completeness, optimality)? (1 mark)
- Give an example of a problem that is *easier* for the DFS-MRV solver than it is for the DFS solver, and explain why (1 mark)
- Empirically compare the quality of the first solution found by DFS and DFS-MRV compared to the optimal solution (1 mark)
- Empirically compare DFS-MRV with DFS in terms of the number of nodes expanded (1 mark)

For the empirical evaluations, run the two algorithms on a variety of problems of size  $n$  for varying  $n$ . Note that the domain splitting CSP solver with costs should always find an optimal solution.

- What is the worst case time and space complexity of each algorithm (give a general form in terms of fuzzy scheduling problem sizes)? (1 mark)

n: number of tasks, d: maximum domain size

DFS: Time:  $O(D^n)$ , Space:  $O(n)$

DFS-MRV:  $O(D^n)$ , Space  $O(n^*d)$

- What are the properties of the search algorithms (completeness, optimality)? (1 mark)

Both are complete for finite CSP, and guaranteed to find a solution if it exists.

Neither are optimal, as they stop on the first valid solution.

- Give an example of a problem that is easier for the DFS-MRV solver than it is for the DFS solver, and explain why (1 mark)

An Example problem would be where we have a constrained task t1, which has a hard domain forcing to be on monday and a binary constraint such as t1 same-day t2. DFS-MRV would deal with this better because it would select the most constrained variable t1, and through forward checking, it would prune invalid t2 paths, allowing it to not explore invalid branches. However DFS may assign t2 to tuesday and have to backtrack after discovering the same-day conflict.

- Empirically compare the quality of the first solution found by DFS and DFS-MRV compared to the optimal solution (1 mark)

We can see initially that the DFS and DFS-MRV are similar in terms of quality of solution, but at some higher n values such as 6 that the DFS finds a less costly solution compared to DFS-MRV. For example in n=6, the DFS is 1.54x more expensive than the optimal solution while DFS-MRV is 3.27x more expensive.

Problem Size n=6: DFS Nodes Expanded: 165.4 DFS-MRV Nodes Expanded: 8.0 Node Reduction: 95.2% DFS Cost Ratio: 1.54x DFS-MRV Cost Ratio: 3.27x

- Empirically compare DFS-MRV with DFS in terms of the number of nodes expanded (1 mark) For number of nodes expanded we can see that the DFS-MRV generally expands less nodes. For example at n=6, DFS-MRV expanded 8 nodes, while DFS expanded 165.4 which is a 95.2% difference. The general trend shows DFS-MRV reduces significantly less nodes compared to DFS

#### Answers for Question 4

If you want to submit additional code, put this at the end of the notebook. Here just give the answers (including plots or tables).

### Question 5 (4 marks)

The DFS solver chooses variables in random order, and systematically explores all values for those variables in no particular order.

Incorporate costs into the DFS constraint solver as heuristics to guide the search. Similar to the cost function for the domain splitting solver, for a given variable  $v$ , the cost of assigning the value  $val$  to  $v$  is the cost of violating the soft deadline constraint (if any) associated with  $v$  for the value  $val$ . The *minimum cost* for  $v$  is the lowest cost from amongst the values in the domain of  $v$ . The DFS solver should choose a variable  $v$  with lowest minimum cost, and explore its values in order of cost from lowest to highest.

- Implement this behaviour by modifying the code in `dfs_solver` and place a copy of the code below (2 marks)

- Empirically compare the performance of DFS with and without these heuristics (2 marks)

For the empirical evaluations, again run the two algorithms on a variety of problems of size  $n$  for varying  $n$ .

### **Empirically compare the performance of DFS with and without these heuristics (2 marks)**

We can see empirically that that the DFS with cost may have significantly more nodes explores in the magnitude of 1000s more. However in terms of optimal solution quality we can see that DFS cost manages to find a very optimal cost solution wheras DFS without cost is a significantly less optimal solution.

```

Optimal cost: 530.0

## Answers for Question 5

Write the other answers here.

## Question 6 (3 marks)

The CSP solver with domain splitting splits a CSP variable domain into *exactly two* partitions. Poole & Mackworth claim that in practice, this is as good as splitting into a larger number of partitions. In this question, empirically evaluate this claim for fuzzy scheduling CSPs.

- Write a new `partition_domain` function that partitions a domain into a list of `k` partitions, where `k` is a parameter to the function (1 mark)
- Modify the CSP solver to use the list of `k` partitions and evaluate the performance of the solver using the above metric for a range of values of `k` (2 marks)

**- Modify the CSP solver to use the list of `k` partitions and evaluate the performance of the solver using the above metric for a range of values of `k` (2 marks)**

We can see the performance that the  $k=2$  partitions is just as good as all other partitioning methods, as the average nodes expanded is less than the other  $k$  partitions. Thus supporting the claim for fuzzy scheduling CSPs

```
In [66]: def partition_domain_k(dom, k):  
    dom_list = sorted(dom)  
    n = len(dom_list)
```

```
if k >= n:
    return [set([val]) for val in dom_list]

partitions = []
base_size = n // k
remainder = n % k

start_idx = 0
for i in range(k):
    size = base_size + (1 if i < remainder else 0)
    end_idx = start_idx + size
    partitions.append(set(dom_list[start_idx:end_idx]))
    start_idx = end_idx

return partitions
```

In [67]: *#modified csp class to have k partitioning*

```

        neighs.append(Arc(node, csp_node))
    else:
        self.display(2, f"...{var} in {dom} has no solution")

    return neighs
